CHAPTER 1

INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.)

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies--for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.)

The information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of tests are used. These tests are designed to perform checks at compile time, at link time, and during execution.

(2) ←

INTRODUCTION

1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

- . To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard
- . To attempt to identify any language constructs not supported by the compiler but required by the Ada Standard
- . To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by SofTech, Inc. under the direction of the AVF according to procedures established by the Ada Joint Program Office and administered by the Ada Validation Organization (AVO). On-site testing was completed 22 June 1988 at Intermetrics, Inc., Cambridge MA.

1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse
Ada Joint Program Office
OUSDRE
The Pentagon, Rm 3D-139 (Fern Street)
Washington DC 20301-3081

or from:

Ada Validation Facility
ASD/SCEL
Wright-Patterson AFB OH 45433-6503

Questions regarding this report or the validation test results should be directed to the AVF listed above or to:

INTRODUCTION

1.4 DEFINITION OF TERMS

ACVC	The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.
Ada Commentary	An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.
Ada Standard	ANSI/MIL-STD-1815A, February 1983 and ISO 8652-1987.
Applicant	The agency requesting validation.
AVF	The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the <u>Ada Compiler Validation Procedures and Guidelines</u> .
AVO	The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices.
Compiler	A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.
Failed test	An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.
Host	The computer on which the compiler resides.
Inapplicable test	An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.
Passed test	An ACVC test for which a compiler generates the expected result.
Target	The computer for which a compiler generates code.
Test	A program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files.
Withdrawn test	An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect

because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.

1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. There are no explicit program components in a Class A test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters--for example, the number of identifiers permitted in a compilation or the number of units in a library--a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

INTRODUCTION

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time--that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK_FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK_FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of REPORT and CHECK_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values--for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of this validation are given in Appendix D.

CHAPTER 2
CONFIGURATION INFORMATION

2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: CMS Ada Real-Time Compiler, Version 202.35

ACVC Version: 1.9

Certificate Number: 880617W1.09116

Host Computer:

Machine:	IBM 3083
Operating System:	CMS, Release 4
Memory Size:	24 megabytes

Target Computer:

Machine:	IBM 3083
Operating System:	CMS, Release 4
Memory Size:	24 megabytes

CONFIGURATION INFORMATION

2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

- . Capacities.

The compiler correctly processes tests containing loop statements nested to 33 levels and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. Block statements nested to 65 levels are not supported. (See tests D55A03A..H (8 tests), D64005E..G (3 tests), and D29002K.)

- . Universal integer calculations.

An implementation is allowed to reject universal integer calculations having values that exceed `SYSTEM.MAX_INT`. This implementation processes 64 bit integer calculations. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

- . Predefined types.

This implementation supports the additional predefined type `SHORT_FLOAT` in the package `STANDARD`. (See tests B86001C and B86001D.)

- . Based literals.

An implementation is allowed to reject a based literal with a value exceeding `SYSTEM.MAX_INT` during compilation, or it may raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` during execution. This implementation raises `NUMERIC_ERROR` during execution. (See test E24101A.)

- . Expression evaluation.

Apparently no default initialization expressions for record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with the same precision as the base type. (See test C35712B.)

This implementation uses no extra bits for extra precision. This implementation uses all extra bits for extra range. (See test C35903A.)

Sometimes `NUMERIC_ERROR` is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

No exception is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is not gradual. (See tests C45524A..Z.)

. Rounding.

The method used for rounding to integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round away from zero. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round away from zero. (See test C4A014A.)

. Array types.

An implementation is allowed to raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` for an array having a `'LENGTH` that exceeds `STANDARD.INTEGER'LAST` and/or `SYSTEM.MAX_INT`. For this implementation:

Declaration of an array type or subtype declaration with more than `SYSTEM.MAX_INT` components raises no exception. (See test C36003A.)

No exception is raised when `'LENGTH` is applied to an array type with `INTEGER'LAST + 2` components. (See test C36202A.)

No exception is raised when `'LENGTH` is applied to an array type with `SYSTEM.MAX_INT + 2` components. (See test C36202B.)

A packed `BOOLEAN` array having a `'LENGTH` exceeding `INTEGER'LAST` raises `NUMERIC_ERROR` when the array type is declared. (See test C52103X.)

A packed two-dimensional `BOOLEAN` array with more than `INTEGER'LAST` components raises `NUMERIC_ERROR` when the array type is declared. (See test C52104Y.)

CONFIGURATION INFORMATION

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC_ERROR or CONSTRAINT_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises NUMERIC_ERROR when the array type is declared. (See test E52103Y.)

In assigning one-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

. Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications. (See test E38104A.)

In assigning record types with discriminants, the expression does not appear to be evaluated in its entirety before CONSTRAINT_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

. Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, not all choices are evaluated before being checked for identical bounds. (See test E43212B.)

All choices are evaluated before CONSTRAINT_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

. Representation clauses.

For this implementation:

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is used by a test in a way that violates a

restriction, then the implementation must reject it.

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for derived types are not supported. (See tests C35508I..J and C35508M..N.)

Length clauses with SIZE specifications for enumeration types are not supported. (See test A39005B.)

Length clauses with STORAGE_SIZE specifications for access types are not supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE_SIZE specifications for task types are not supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are not supported. (See tests A39005E and C87B62C.)

Record representation clauses with an alignment clause are not supported. (See test A39005G.)

Length clauses with SIZE specifications for derived integer types are not supported. (See test C87B62A.)

. Pragma.

The pragma `INLINE` is supported for procedures and functions. (See tests LA3004A, LA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

. Input/output.

The package `SEQUENTIAL_IO` cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D, and EE2201E.)

The package `DIRECT_IO` cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101H, EE2401D, and EE2401G.)

Modes `IN_FILE` and `OUT_FILE` are supported for `SEQUENTIAL_IO`. (See tests CE2102D and CE2102E.)

CONFIGURATION INFORMATION

Modes `IN_FILE`, `OUT_FILE`, and `INOUT_FILE` are supported for `DIRECT_IO`. (See tests CE2102F, CE2102I, and CE2102J.)

`RESET` and `DELETE` are supported for `SEQUENTIAL_IO` and `DIRECT_IO`. (See tests CE2102G and CE2102K.)

Dynamic creation and deletion of files are supported for `SEQUENTIAL_IO` and `DIRECT_IO`. (See tests CE2106A and CE2106B.)

Overwriting to a sequential file does not truncate the file. (See test CE2208B.)

An existing text file can be opened in `OUT_FILE` mode, cannot be created in `OUT_FILE` mode, and cannot be created in `IN_FILE` mode. (See test EE3102C.)

Only one internal file can be associated with each external file for text I/O for both reading and writing. (See tests CE3111A..E (5 tests), CE3114B, and CE3115A.)

Only one internal file can be associated with each external file for sequential I/O for both reading and writing. (See tests CE2107A..D (4 tests), CE2110B, and CE2111D.)

More than one internal file can be associated with each external file for direct I/O for both reading and writing. (See tests CE2107F..I (5 tests), CE2110B, and CE2111H.)

An internal sequential access file and an internal direct access file can be associated with a single external file for writing. (See test CE2107E.)

Temporary sequential files and temporary direct files are given names. Temporary files given names are deleted when they are closed. (See tests CE2108A and CE2108C.)

. Generics.

Body and subunits of a generic unit must be in the same compilation as the specification if instantiations precede them. (See tests CA2009C and CA2009F.)

CHAPTER 3
TEST INFORMATION

3.1 TEST RESULTS

Version 1.9 of the ACVC comprises 3122 tests. When this compiler was tested, 27 tests had been withdrawn because of test errors. The AVF determined that 277 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing except for 201 executable tests that use floating-point precision exceeding that supported by the implementation. Modifications to the code, processing, or grading for 5 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

3.2 SUMMARY OF TEST RESULTS BY CLASS

RESULT	TEST CLASS						TOTAL
	A	B	C	D	E	L	
Passed	103	1046	1595	14	14	46	2818
Inapplicable	7	5	258	3	4	0	277
Withdrawn	3	2	21	0	1	0	27
TOTAL	113	1053	1874	17	19	46	3122

TEST INFORMATION

3.3 SUMMARY OF TEST RESULTS BY CHAPTER

RESULT	CHAPTER														TOTAL
	2	3	4	5	6	7	8	9	10	11	12	13	14		
Passed	190	491	528	239	166	98	137	327	135	36	234	3	234	2818	
Inapplicable	14	81	146	9	0	0	6	0	2	0	0	0	19	277	
Withdrawn	2	14	3	0	0	1	2	0	0	0	2	1	2	27	
TOTAL	206	586	677	248	166	99	145	327	137	36	236	4	255	3122	

3.4 WITHDRAWN TESTS

The following 27 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

B28003A	E28005C	C34004A	A35902C	C35502P
C35904A	C35904B	C35A03E	C35A03R	C37213H
C37213J	C37215C	C37215E	C37215G	C37215H
C38102C	C41402A	C45332A	C45614C	A74106C
C85018B	C87B04B	BC3105A	CC1311B	AD1A01A
CE2401H	CE3208A			

See Appendix D for the reason that each of these tests was withdrawn.

3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 277 tests were inapplicable for the reasons indicated:

- C35508I..J (2 tests) and C35508M..N (2 tests) use enumeration representation clauses for derived types. These clauses are not supported by this compiler.
- C35702B uses LONG_FLOAT which is not supported by this implementation.

- . A39005B and C87B62A use length clauses with SIZE specifications for derived integer types or for enumeration types which are not supported by this compiler.
- . A39005C..D (2 tests), C87B62B and C87B62D use length clauses with STORAGE_SIZE specifications for access types or for task types which are not supported by this implementation.
- . A39005E and C87B62C use length clauses with SMALL specifications which are not supported by this implementation.
- . A39005G uses a record representation clause with an alignment clause which is not supported by this compiler.
- . The following tests use SHORT_INTEGER, which is not supported by this compiler:

C45231B	C45304B	C45502B	C45503B	C45504B
C45504E	C45611B	C45613B	C45614B	C45631B
C45632B	B52004E	C55B07B	B55B09D	

- . The following tests use LONG_INTEGER, which is not supported by this compiler:

C45231C	C45304C	C45502C	C45503C	C45504C
C45504F	C45611C	C45613C	C45631C	C45632C
B52004D	C55B07A	B55B09C		

- . C45231D requires a macro substitution for any predefined numeric types other than INTEGER, SHORT_INTEGER, LONG_INTEGER, FLOAT, SHORT_FLOAT, and LONG_FLOAT. This compiler does not support any such types.
- . C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this compiler.
- . C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed-point base types which are not supported by this compiler.
- . D55A03G..H (2 tests) use more than 33 levels of loop nesting which exceeds the capacity of the compiler.
- . D56001B uses 65 levels of block nesting which exceeds the capacity of the compiler.
- . B86001D requires a predefined numeric type other than those defined by the Ada language in package STANDARD. There is no such type for this implementation.
- . C86001F redefines package SYSTEM, but TEXT_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT_IO.

TEST INFORMATION

- . CA2009C and CA2009F compile generic subunits in separate compilation files. For this implementation, the body and subunits of a generic unit must be in the same compilation as the specification if instantiations precede them.
- . AE2101C, EE2201D, and EE2201E use instantiations of package SEQUENTIAL_IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.
- . AE2101H, EE2401D, and EE2401G use instantiations of package DIRECT_IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.
- . CE2107A..D (4 tests), CE2110B, CE2111D, CE3111A..E (5 tests), CE3114B, and CE3115A are inapplicable because multiple internal files cannot be associated with the same external file for sequential I/O or text I/O. The proper exception is raised when multiple access is attempted.
- . The following 201 tests require a floating-point accuracy that exceeds the maximum of 15 digits supported by this implementation:

C24113L..Y (14 tests)	C35705L..Y (14 tests)
C35706L..Y (14 tests)	C35707L..Y (14 tests)
C35708L..Y (14 tests)	C35802L..Z (15 tests)
C45241L..Y (14 tests)	C45321L..Y (14 tests)
C45421L..Y (14 tests)	C45521L..Z (15 tests)
C45524L..Z (15 tests)	C45621L..Z (15 tests)
C45641L..Y (14 tests)	C46012L..Z (15 tests)

3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into subtests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).

Modifications were required for 5 Class B tests.

The following Class B tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

B49003A B49005A BA1101C4 BC3205D BC3604A

3.7 ADDITIONAL TESTING INFORMATION

3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the CMS Ada Real-Time Compiler, Version 202.35, was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

3.7.2 Test Method

Testing of the CMS Ada Real-Time Compiler, Version 202.35, using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of an IBM 3083 operating under CMS, Release 4.

A magnetic tape containing all tests except for withdrawn tests and tests requiring unsupported floating-point precisions was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized before being written to the magnetic tape. Tests requiring modifications during the prevalidation testing were included in their modified form on the magnetic tape.

The contents of the magnetic tape were loaded directly onto the host computer. After the test files were loaded to disk, the full set of tests was compiled on the IBM 3083, and all executable tests were linked and run on the IBM 3083. Results were printed from the host computer.

The compiler was tested using command scripts provided by Intermetrics, Inc. and reviewed by the validation team. The compiler was tested using all default switch settings.

The Intermetrics CMS Ada Compiler was invoked using the "adacomp" exec. A program build (link) was done using "adalink." A program library was created using the "cre_cat" command of PLM, the program library manager, or by the "adaplib" exec. The Report Package and CHECK_FILE were compiled into a base program library before the start of validation testing. Then, each new program library that is created has access to these packages. This avoids their recompilation each time a new library is created.

The validation testing was controlled using a batch facility on the IBM 3083. Automated testing tools were used to ensure that the same environment was used for each ACVC test by reinitializing the library before each ACVC test. A UTS system was used to prepare the scripts for

TEST INFORMATION

running the tests, to submit the tests to CMS for processing, to analyze the results, and to print the outputs and listing files.

Tests were compiled, linked, and executed (as appropriate) using a single host computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

3.7.3 Test Site

Testing was conducted at Intermetrics, Inc., Cambridge MA and was completed on 22 June 1988. The IBM 3083 was not dedicated to the testing effort.

APPENDIX A

DECLARATION OF CONFORMANCE

Intermetrics, Inc. has submitted the following
Declaration of Conformance concerning the CMS Ada
Real-Time Compiler, Version 202.35.

DECLARATION OF CONFORMANCE

DECLARATION OF CONFORMANCE

Compiler Implementor: Intermetrics, Inc.
Ada Validation Facility: Ada Validation Facility, ASD/SCEL,
Wright-Patterson AFB OH 45433-6503
Ada Compiler Validation Capability (ACVC) Version: 1.9

Base Configuration

Base Compiler Name: CMS Ada Real-Time Compiler	Version: 202.35
Host Architecture ISA: IBM 3083	OS&VER #: CMS, 4
Target Architecture ISA: IBM 3083	OS&VER #: CMS, 4

Implementor's Declaration

I, the undersigned, representing Intermetrics, Inc., have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler(s) listed in this declaration. I declare that Intermetrics, Inc. is the owner of record of the Ada language compiler(s) listed above and, as such, is responsible for maintaining said compiler(s) in conformance to ANSI/MIL-STD-1815A. All certificates and registrations for Ada language compiler(s) listed in this declaration shall be made only in the owner's corporate name.

Intermetrics, Inc.
Dennis Struble, Deputy General Manager

Date: 6/20/88

Owner's Declaration

I, the undersigned, representing Intermetrics, Inc., take full responsibility for implementation and maintenance of the Ada compiler(s) listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada language compilers listed, and their host/target performance, are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A.

Intermetrics, Inc.
Dennis Struble, Deputy General Manager

Date: 6/20/88

APPENDIX B

APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the CMS Ada Real-Time Compiler, Version 202.35, are described in the following sections, which discuss topics in Appendix F of the Ada Standard. Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is

...

type INTEGER is range -2_147_483_647 .. 2_147_483_647;

type FLOAT is digits 15 range 2.0**(-205) .. (1.0-2**(-51))*2.0**204;

type SHORT_FLOAT is digits 6 range 2.0**(-85) .. 2.0**84;

type DURATION is delta 2.0**(-14) range -86_400 .. 86_400;

...

end STANDARD;

Appendix F. IMPLEMENTATION DEPENDENCIES

This section constitutes Appendix F of the Ada LRM for this implementation. The following quotations are from the standard LRM Appendix F:

The Ada language allows for certain machine-dependencies in a controlled manner. No machine-dependent syntax or semantic extensions or restrictions are allowed. The only allowed implementation-dependencies correspond to implementation-dependent pragmas and attributes, certain machine-dependent conventions as mentioned in Chapter 13, and certain allowed restrictions on representation clauses.

The reference manual of each Ada implementation must include an appendix (called Appendix F) that describes all implementation-dependent characteristics. The Appendix F for a given implementation must list in particular:

- 1. The form, allowed places, and effect of every implementation-dependent pragma.*
- 2. The name and the type of every implementation-dependent attribute.*
- 3. The specification of the package SYSTEM (see 13.7).*
- 4. The list of all restrictions on representation clauses (see 13.1).*
- 5. The conventions used for any implementation-generated name denoting implementation-dependent components (see 13.4).*
- 6. The interpretation of expressions that appear in address clauses, including those for interrupts (see 13.5).*
- 7. Any restriction on unchecked conversions (see 13.10.2).*
- 8. Any implementation-dependent characteristics of the input-output packages (see 14).*

In addition, the present section will describe the following topics:

1. Any implementation-dependent rules for termination of tasks dependent on library packages (see 9.4:13).
2. Other implementation dependencies.
3. Compiler capacity limitations.

F.1 Pragmas

This section describes the form, allowed places, and effect of every implementation-dependent pragma.

F.1.1 Pragmas *LIST*, *PAGE*, *PRIORITY*, *ELABORATE*

Pragmas *LIST*, *PAGE*, *PRIORITY* and *ELABORATE* are supported exactly in the form, in the allowed places, and with the effect as described in the LRM.

F.1.2 Pragma *SUPPRESS*

Form: Pragma *SUPPRESS* (identifier)
where the identifier is that of the check that can be omitted. This is as specified in LRM B(14), except that suppression of checks for a particular name is not supported. The name clause (*ON=>name*), if given, causes the entire pragma to be ignored.

The suppression of the following run-time checks, which correspond to situations in which the exceptions *CONSTRAINT_ERROR*, *STORAGE_ERROR*, or *PROGRAM_ERROR* may be raised, are supported:

ACCESS_CHECK
DISCRIMINANT_CHECK
INDEX_CHECK
LENGTH_CHECK
RANGE_CHECK
STORAGE_CHECK
ELABORATION_CHECK

The checks which correspond to situations in which the exception *NUMERIC_ERROR* may be raised occur in the hardware and therefore pragma *SUPPRESS* of *DIVISION_CHECK* and *OVERFLOW_CHECK* are not supported.

Allowed Places: As specified in LRM B(14) : *SUPPRESS*.

Effect: Permits the compiler not to emit code in the unit being compiled to perform various checking operations during program execution. The supported checks have the effect of suppressing the specified check as described in the LRM. A pragma *SUPPRESS* specifying an unsupported check is ignored.

F.1.3 Pragma *SUPPRESS_ALL*

Form: Pragma *SUPPRESS_ALL*

Allowed Places: As specified in LRM B(14) for pragma SUPPRESS.

Effect: The implementation-defined pragma SUPPRESS_ALL has the same effect as the specification of a pragma SUPPRESS for each of the supported checks.

F.1.4 Pragma INLINE

Form: Pragma INLINE (SubprogramNameCommaList)

Allowed Places: As specified in LRM B(4) : INLINE

Effect: If the subprogram body is available, and the subprogram is not recursive, the code is expanded in-line at every call site and is subject to all optimizations.

The stack-frame needed for the elaboration of the inline subprogram will be allocated as a temporary in the frame of the containing code.

Parameters will be passed properly, by value or by reference, as for non-inline subprograms. Register-saving and the like will be suppressed. Parameters may be stored in the local stack-frame or held in registers, as global code generation allows.

Exception-handlers for the INLINE subprogram will be handled as for block-statements.

Use: This pragma is used either when it is believed that the time required for a call to the specified routine will in general be excessive (this for frequently called subprograms) or when the average expected size of expanded code is thought to be comparable to that of a call.

F.1.5 Pragma INTERFACE

Form: Pragma INTERFACE (language_name, subprogram_name)
where the language_name must be an enumeration value of the type SYSTEM.Supported_Language_Name (see Package SYSTEM below).

Allowed Place: As specified in LRM B(5) : INTERFACE.

Effect: Specifies that a subprogram will be provided outside the Ada program library and will be callable with a specified calling interface. Neither an Ada body nor an Ada body_stub may be provided for a subprogram for which INTERFACE has been specified.

Use: Use with a subprogram being provided via another programming language and for which no body will be given in any Ada program. See

also the `LINK_NAME` pragma.

The calling conventions for an Ada program calling a `PRAGMA INTERFACE (ASSEMBLER)` subprogram are as follows. General register 1 points to a list of addresses, each of which is the address of a parameter. The last address in the list shall have its high-order bit turned on; this bit will be off for every other address.

For a `PRAGMA INTERFACE (AIE_ASSEMBLER)` subprogram, standard Ada calling conventions will be followed, but no Ada body is expected or allowed.

F.1.6 Pragma LINK_NAME

Form: `Pragma LINK_NAME (subprogram_name, link_name)`

Allowed Places: As specified in LRM B(5) for pragma `INTERFACE`.

Effect: Associates with subprogram `subprogram_name` the name `link_name` both as its CSECT name and as its entry point name.

Use: To allow Ada programs, with help from `INTERFACE` pragma, to reference non-Ada subprograms. Also allows non-Ada programs to call specified Ada subprograms.

F.1.7 Pragma CONTROLLED

Form: `Pragma CONTROLLED (AccessTypeName)`

Allowed Places: As specified in LRM B(2) : `CONTROLLED`.

Effect: Means that heap objects are not automatically reclaimed but are explicitly reclaimable by use of `unchecked_deallocation`.

F.1.8 Pragma PACK

Form: `Pragma PACK (type_simple_name)`

Allowed Places: As specified in LRM 13.1(12)

Effect: Components are allowed their minimal number of storage units as provided for by their own representation and/or packing.

Floating-point components are aligned on storage-unit boundaries, either 4 bytes or 8 bytes, depending on digits.

Use: `Pragma PACK` is used to reduce storage size. This can allow records and arrays, in some cases, to be passed by value instead of by reference.

Size reduction usually implies an increased cost of accessing components. The decrease in storage size may be offset by increase in size of accessing code and by slowing of accessing operations.

*F.1.9 Pragas SYSTEM_NAME, STORAGE_UNIT,
MEMORY_SIZE, SHARED*

These pragmas are not supported and are ignored.

F.1.10 Pragma OPTIMIZE

Pragma OPTIMIZE is ignored; optimization is always enabled.

F.2 Implementation-dependent Attributes

This section describes the name and the type of every implementation-dependent attribute.

There are no implementation defined attributes. These are the values for certain language-defined, implementation-dependent attributes:

Type INTEGER.

INTEGER'SIZE	= 32 - bits.
INTEGER'FIRST	= - (2**31)
INTEGER'LAST	= (2**31-1)

Type SHORT_FLOAT.

SHORT_FLOAT'SIZE	= 32 - bits.
SHORT_FLOAT'DIGITS	= 6
SHORT_FLOAT'MANTISSA	= 21
SHORT_FLOAT'EMAX	= 84
SHORT_FLOAT'EPSILON	= 2.0**(-20)
SHORT_FLOAT'SMALL	= 2.0**(-85)
SHORT_FLOAT'LARGE	= 2.0**84
SHORT_FLOAT'MACHINE_ROUNDS	= false
SHORT_FLOAT'MACHINE_RADIX	= 16
SHORT_FLOAT'MACHINE_MANTISSA	= 6
SHORT_FLOAT'MACHINE_EMAX	= 63
SHORT_FLOAT'MACHINE_EMIN	= -64
SHORT_FLOAT'MACHINE_OVERFLOW	= false
SHORT_FLOAT'SAFE_EMAX	= 252
SHORT_FLOAT'SAFE_SMALL	= 16#0.800000#E-63
SHORT_FLOAT'SAFE_LARGE	= 16#0.FFFFFF8#E63

Type FLOAT.

FLOAT'SIZE	= 64 - bits.
FLOAT'DIGITS	= 15
FLOAT'MANTISSA	= 51
FLOAT'EMAX	= 204
FLOAT'EPSILON	= 2.0**(-50)
FLOAT'SMALL	= 2.0**(-205)
FLOAT'LARGE	= (1.0-2**(-51))*2.0**204
FLOAT'MACHINE_ROUNDS	= false
FLOAT'MACHINE_RADIX	= 16
FLOAT'MACHINE_MANTISSA	= 14
FLOAT'MACHINE_EMAX	= 63
FLOAT'MACHINE_EMIN	= -64
FLOAT'MACHINE_OVERFLOW	= false

FLOAT'SAFE_EMAX	= 252
FLOAT'SAFE_SMALL	= 16#0.8000000000000000#E-63
FLOAT'SAFE_LARGE	= 16#0.FFFFFFFFFFFFFFFE0#E63

Type DURATION.

DURATION'DELTA	= 2.0**(-14) -- seconds
DURATION'FIRST	= - 86,400
DURATION'LAST	= 86,400
DURATION'SMALL	= 2.0**(-14)

Type PRIORITY.

PRIORITY'FIRST	= -127
PRIORITY'LAST	= 127

F.3 Package SYSTEM

package SYSTEM is

type ADDRESS is private; -- "=", "/=" defined implicitly

type ADDRESS_OFFSET is new INTEGER;

type ADDRESS_SEGMENT is new INTEGER;

function "+"(addr : ADDRESS; offset : ADDRESS_OFFSET)
return ADDRESS;

function "-"(offset : ADDRESS_OFFSET; addr : ADDRESS)
return ADDRESS;

-- Provide addition between an address and
-- (within-segment) offset

function "-"(left, right : ADDRESS) return ADDRESS_OFFSET;
-- Derive offset between two Addresses.
-- raises CONSTRAINT_ERROR if segments
-- differ

function OFFSET_OF (addr : ADDRESS) return ADDRESS_OFFSET;

function SEGMENT_OF (addr : ADDRESS) return ADDRESS_SEGMENT;
-- Extract components of an Address

function MAKE_ADDRESS (
offset : ADDRESS_OFFSET;
segment : ADDRESS_SEGMENT := 0) return ADDRESS;
-- Construct an Address from components

type NAME is (UTS, CMS, MVS, ACS_1100, PRIME, AF1750A);
-- Target dependent

SYSTEM_NAME : constant NAME := CMS ; -- Target dependent

type Supported_Language_Name is (-- Target dependent

AIE_ASSEMBLER, -- assemble with 3 register parameter
ASSEMBLER -- CMS Assembler Program

);

```
STORAGE_UNIT : constant := 8; -- Target dependent
MEMORY_SIZE : constant := 2**24 ; -- Target dependent
MIN_INT : constant := INTEGER'POS(INTEGER'FIRST);
MAX_INT : constant := INTEGER'POS(INTEGER'LAST);
MAX_DIGITS : constant := 15; -- Target dependent
MAX_MANTISSA : constant := 31; -- Target dependent
FINE_DELTA : constant := 2.0**(-31);
TICK : constant := 1.0;
subtype PRIORITY is INTEGER range -127..127;
```

```
private
  type ADDRESS is -- CMS/Ada implementation dependent
end SYSTEM ;
```

F.4 Representation Clauses

This section describes the list of all restrictions on representation clauses.

"NOTE: An implementation may limit its acceptance of representation clauses to those that can be handled simply by the underlying hardware.... If a program contains a representation clause that is not accepted [by the compiler], then the program is illegal." (LRM 13.1(10)). There are no restrictions except as follows.

- a. Length-clauses are not supported.
- b. Address-clauses are not supported.
- c. Record-representation-clause:

Alignment clauses are not supported and the use of an alignment clause will cause a compile-time error.

Within a record-representation-clause, the object being represented must be no larger than one 32-bit word.

The range of bits specified must be in the range of 0..31.

Record components, including those generated implicitly by the compiler, whose locations are not given by the representation-clause, are layed out by the compiler following all the components whose locations are given by the representation-clause. Such components of the invariant part of the record are allocated to follow the user-specified components of the invariant part, and such components in any given variant part are allocated to follow the user-specified components of that variant part.

F.5 Implementation-dependent Components

This section describes the conventions used for any implementation-generated name denoting implementation-dependent components.

There are no implementation-generated names denoting implementation-dependent (record) components, although there are, indeed, such components. Hence, there is no convention (or possibility) of naming them and, therefore, no way to offer a representation clause for a record containing such components.

NOTE: Records containing dynamic-sized components will contain (generally) unnamed offset components which will "point" to the dynamic-sized components stored later in the record. There is no way to specify the representation of such components.

F.6 Address Clauses

This section describes the interpretation of expressions that appear in address clauses, including those for interrupts.

Address clauses are not allowed.

F.7 Unchecked Conversions

This section describes any restrictions on unchecked conversions.

The source and target values must both be of an integer, enumeration, or access type.

F.8 Input-Output

This section describes implementation-dependent characteristics of the input-output packages.

- (a) Declaration of type `Direct_IO.Count`? [14.2.5]
0..Integer'last;
- (b) Effect of input/output for access types?
Not meaningful if read by different program invocations
- (c) Disposition of unclosed `IN_FILE` files at program termination? [14.1(7)]
Files are closed by the operating system at termination of calling `EXEC`.
- (d) Disposition of unclosed `OUT_FILE` files at program termination? [14.1(7)]
Files are closed by the operating system at termination of calling `EXEC`.
- (e) Disposition of unclosed `INOUT_FILE` files at program termination? [14.1(7)]
Files are closed by the operating system at termination of calling `EXEC`.
- (f) Form of, and restrictions on, file names? [14.1(1)]
Standard CMS conventions. '*' may be used for file mode, in which case a standard CMS file search will be performed.
- (g) Possible uses of `FORM` parameter in I/O subprograms? [14.1(1)]
The `FORM` string may contain 4 parameters:
 - i. `RECFM` and `RECSIZE` may specify CMS record format.
 - ii. `PRINT` (boolean) tells whether a text file is printer-destined.
 - iii. `EBCDIC` (boolean) tells whether the external file is in EBCDIC and should be converted to/from ASCII internally.
- (h) Where are I/O exceptions raised beyond what is described in Chapter 14? [14.1(11)]
None raised.
- (i) Are alternate specifications (such as abbreviations) allowed for file names? If so, what is the form of these alternatives? [14.2.1(21)]
No.
- (j) When is `DATA_ERROR` not raised for sequential or direct input of an inappropriate `ELEMENT_TYPE`? [14.2.2(4), 14.2.4(4)]
When it can be assigned without `CONSTRAINT_ERROR` to a variable of `ELEMENT_TYPE`.
- (k) What are the standard input and standard output files? [14.3(5)]
These default to the user's terminal. They may be redirected to CMS disk files via the CMS "FILEDEF" command. Standard

output may be appended to an existing CMS file.

- (l) What are the forms of line terminators and page terminators? [14.3(7)]

Internally (to the Ada programmer):

Line terminator is ASCII.LF (line feed)

Page terminator is ASCII.FF (form feed)

In the external EBCDIC file, these are converted to end-of-record and "new-page" carriage control (that is, standard IBM conventions). Due to restrictions imposed by CMS, page terminators and zero-length lines can exist only in printer-destined files.

- (m) Value of Text_IO.Count'last? [14.3(8)]

integer'last

- (n) Value of Text_IO.Field'last? [14.3.7(2)]

integer'last

- (o) Effect of instantiating ENUMERATION_IO for an integer type? [14.3.9(15)]

The instantiated Put will work properly, but the instantiated Get will raise Data_Error.

- (p) Restrictions on types that can be instantiated for input/output?

Neither sequential nor direct I/O may be instantiated over a type which is an unconstrained array type or an unconstrained record type without default values for discriminants.

- (q) Specification of package Low_Level_IO? [14.6]

Low_Level_IO is not provided.

- (r) Additional Restrictions

More than one internal file may not simultaneously access the same external file (except for direct_io files opened for input).

F.9 Tasking

This section describes implementation-dependent characteristics of the tasking run-time packages.

The scheduler of the CMS/Ada run-time tasking system runs tasks of equal priority in the order that they became eligible to run and allows them to run until blocked or until interrupted by the eligibility of a task of higher priority.

A task whose priority is higher than the task currently running may be made eligible to run by an interrupt or timer runout. Such an event will cause the currently running task to be immediately blocked so that the higher priority task may run.

Even though a main program completes and terminates (its dependent tasks, if any, having terminated), the execution of the program as a whole continues until each task dependent upon a library unit package has either terminated or reached an open terminate alternative. See LRM 9.4(13).

F.10 Other Matters

This section describes other implementation-dependent characteristics of the system.

- a. Package Machine_Code:
Will not be provided.
- b. Order of compilation of generic bodies and subunits (LRM 10.3:9):
Body and subunits of generic must be in the same compilation as the specification if instantiations precede them (see AI-00257/02).

F.11 Compiler Limitations

- (a) Maximum length of variable of type STRING?
2**24-1 characters (Address space size).
- (b) Maximum length of a record?
2**24-1 bytes (Address space size).
- (c) Maximum length of an array?
2**24-1 bytes. (Address space size).
- (d) Maximum size of Ada Program Library?
Limited by available disk storage.
- (e) Maximum length of source line?
255 characters.
- (f) Maximum number of "use" scopes?
Limit is 50. set arbitrarily by SEMANTICS as maximum number of distinct packages actively "used."
- (g) Maximum number of co-existing tasks?
Limited by available memory space.
- (h) Maximum number of tasks initially allocated?
One if any tasking constructs exist; zero if no tasking constructs exist.
- (i) Maximum length of identifier?
255 characters.
- (j) Maximum number of nested loops?
24 nested loops.
- (k) Maximum number of identifiers in symbol table?
Limited only by address space.
- (l) Package nesting limit?
Limited by parse-stack nesting limit, 200.
- (m) Subprogram nesting limit?
Limited by parse-stack nesting limit, 200.
- (n) Logical expression nesting limit?
Limited by parse-stack nesting limit, 200.
- (o) Minimum storage requirement for compiler's operation?
5 megabytes.
- (p) Can compiler provide listing files in variable block format?
Yes.
- (q) Can compiler provide object in fixed block 80 format?
Yes.

- (r) What storage is required, beyond the storage-units for an object, for allocators in heaps; in collections?

Approximately 8 bytes per element plus sixteen bytes for collection as a whole.

APPENDIX C
TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

<u>Name and Meaning</u>	<u>Value</u>
\$BIG_ID1 Identifier the size of the maximum input line length with varying last character.	(1..254 =>'A', 255 =>'1')
\$BIG_ID2 Identifier the size of the maximum input line length with varying last character.	(1..254 =>'A', 255 =>'2')
\$BIG_ID3 Identifier the size of the maximum input line length with varying middle character.	(1..127 =>'A', 128 =>'3', 129..255 =>'A')
\$BIG_ID4 Identifier the size of the maximum input line length with varying middle character.	(1..127 =>'A', 128 =>'4', 129..255 =>'A')
\$BIG_INT_LIT An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.	(1..252 =>'0', 253..255 =>"298")

TEST PARAMETERS

<u>Name and Meaning</u>	<u>Value</u>
\$BIG_REAL_LIT A universal real literal of value 690.0 with enough leading zeroes to be the size of the maximum line length.	(1..249 =>'0', 250..255 =>"69.0E1")
\$BIG_STRING1 A string literal which when catenated with BIG_STRING2 yields the image of BIG_ID1.	(1..100 =>'A')
\$BIG_STRING2 A string literal which when catenated to the end of BIG_STRING1 yields the image of BIG_ID1.	(1..154 =>'A', 155 =>'1')
\$BLANKS A sequence of blanks twenty characters less than the size of the maximum line length.	(1..235 =>' ')
\$COUNT_LAST A universal integer literal whose value is TEXT_IO.COUNT'LAST.	2_147_483_647
\$FIELD_LAST A universal integer literal whose value is TEXT_IO.FIELD'LAST.	2_147_483_647
\$FILE_NAME_WITH_BAD_CHARS An external file name that either contains invalid characters or is too long.	X}/#\$\$-Y
\$FILE_NAME_WITH_WILD_CARD_CHAR An external file name that either contains a wild card character or is too long.	WILDCRD*
\$GREATER_THAN_DURATION A universal real literal that lies between DURATION'BASE'LAST and DURATION'LAST or any value in the range of DURATION.	90_000.0

TEST PARAMETERS

<u>Name and Meaning</u>	<u>Value</u>
\$GREATER_THAN_DURATION_BASE_LAST A universal real literal that is greater than DURATION'BASE'LAST.	10_000_000.0
\$ILLEGAL_EXTERNAL_FILE_NAME1 An external file name which contains invalid characters.	BAD/CHAR
\$ILLEGAL_EXTERNAL_FILE_NAME2 An external file name which is too long.	MUCHTOOLONGNAMEFORAFILE
\$INTEGER_FIRST A universal integer literal whose value is INTEGER'FIRST.	-2_147_483_648
\$INTEGER_LAST A universal integer literal whose value is INTEGER'LAST.	2_147_483_647
\$INTEGER_LAST_PLUS_1 A universal integer literal whose value is INTEGER'LAST + 1.	2_147_483_647 + 1
\$LESS_THAN_DURATION A universal real literal that lies between DURATION'BASE'FIRST and DURATION'FIRST or any value in the range of DURATION.	-90_000.0
\$LESS_THAN_DURATION_BASE_FIRST A universal real literal that is less than DURATION'BASE'FIRST.	-10_000_000.0
\$MAX_DIGITS Maximum digits supported for floating-point types.	15
\$MAX_IN_LEN Maximum input line length permitted by the implementation.	255
\$MAX_INT A universal integer literal whose value is SYSTEM.MAX_INT.	2_147_483_647
\$MAX_INT_PLUS_1 A universal integer literal whose value is SYSTEM.MAX_INT+1.	2_147_483_647 + 1

TEST PARAMETERS

<u>Name and Meaning</u>	<u>Value</u>
\$MAX_LEN_INT_BASED_LITERAL A universal integer based literal whose value is 2#11# with enough leading zeroes in the mantissa to be MAX_IN_LEN long.	(1..2 =>"2:", 3..252 =>'0', 253..255 =>"11:")
\$MAX_LEN_REAL_BASED_LITERAL A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX_IN_LEN long.	(1..3 =>"16:", 4..251 =>'0', 252..255 =>"F.E:")
\$MAX_STRING_LITERAL A string literal of size MAX_IN_LEN, including the quote characters.	(1 => '"', 2..254 =>'A', 255 =>' "')
\$MIN_INT A universal integer literal whose value is SYSTEM.MIN_INT.	-2_147_483_648
\$NAME A name of a predefined numeric type other than FLOAT, INTEGER, SHORT_FLOAT, SHORT_INTEGER, LONG_FLOAT, or LONG_INTEGER.	NO_OTHER_PREDEF_NUM_TYPE
\$NEG_BASED_INT A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX_INT.	16#FFFFFFFE#

APPENDIX D

WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 27 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

- . B28003A: A basic declaration (line 36) incorrectly follows a later declaration.
- . E28005C: This test requires that "PRAGMA LIST (ON);" not appear in a listing that has been suspended by a previous "PRAGMA LIST (OFF);". The Ada Standard is not clear on this point, and the matter will be reviewed by the AJPO.
- . C34004A: The expression in line 168 yields a value outside the range of the target type T, but there is no handler for CONSTRAINT_ERROR.
- . C35502P: The equality operators in lines 62 and 69 should be inequality operators.
- . A35902C: The assignment in line 17 of the nominal upper bound of a fixed-point type to an object raises CONSTRAINT_ERROR, for that value lies outside of the actual range of the type.
- . C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT_ERROR, because its upper bound exceeds that of the type.
- . C35904B: The subtype declaration that is expected to raise CONSTRAINT_ERROR when its compatibility is checked against that of various types passed as actual generic parameters may, in fact, raise NUMERIC_ERROR or CONSTRAINT_ERROR for reasons not anticipated by the test.

WITHDRAWN TESTS

- . C35A03E and C35A03R: These tests assume that attribute 'MANTISSA returns 0 when applied to a fixed-point type with a null range, but the Ada Standard does not support this assumption.
- . C37213H: The subtype declaration of SCONS in line 100 is incorrectly expected to raise an exception when elaborated.
- . C37213J: The aggregate in line 451 incorrectly raises CONSTRAINT_ERROR.
- . C37215C, C37215E, C37215G, and C37215H: Various discriminant constraints are incorrectly expected to be incompatible with type CONS.
- . C38102C: The fixed-point conversion on line 23 wrongly raises CONSTRAINT_ERROR.
- . C41402A: The attribute 'STORAGE_SIZE is incorrectly applied to an object of an access type.
- . C45332A: The test expects that either an expression in line 52 will raise an exception or else MACHINE_OVERFLOW is FALSE. However, an implementation may evaluate the expression correctly using a type with a wider range than the base type of the operands, and MACHINE_OVERFLOW may still be TRUE.
- . C45614C: The function call of IDENT_INT in line 15 uses an argument of the wrong type.
- . A74106C, C85018B, C87B04B, and CC1311B: A bound specified in a fixed-point subtype declaration lies outside of that calculated for the base type, raising CONSTRAINT_ERROR. Errors of this sort occur at lines 37 & 59, 142 & 143, 16 & 48, and 252 & 253 of the four tests, respectively.
- . BC3105A: Lines 159 through 168 expect error messages, but these lines are correct Ada.
- . AD1A01A: The declaration of subtype SINT3 raises CONSTRAINT_ERROR for implementations which select INT'SIZE to be 16 or greater.
- . CE2401H: The record aggregates in lines 105 and 117 contain the wrong values.
- . CE3208A: This test expects that an attempt to open the default output file (after it was closed) with mode IN_FILE raises NAME_ERROR or USE_ERROR; by Commentary AI-00048, MODE_ERROR should be raised.

SUPPLEMENTARY

INFORMATION

Ada Compiler Validation Summary Report:

Compiler Name: CMS Ada Real-Time Compiler, Version 202.35

Certificate Number: 880617W1.09116

Host:

IBM 3083 under
CMS, Release 4

Target:

IBM 3083 under
CMS, Release 4

Testing Completed 22 June 1988 Using ACVC 1.9

This report has been reviewed and is approved.
